

NovaPkg & NovaDrivers

Advanced Arch Linux Management Suite | v0.2 Release

NovaDrivers Overview

NovaDrivers is a deep-system hardware scanner designed for Arch Linux. It automates the detection of critical drivers that are often overlooked during a fresh installation.

Component	Detection Method	Recommended Package
Graphics (GPU)	<code>lspci grep VGA</code>	nvidia / xf86-video-amdgpu
CPU Microcode	<code>/proc/cpuinfo</code> check	intel-ucode / amd-ucode
Audio Engine	PCI Audio Bus probe	pipewire-suite
Connectivity	USB/PCI Bluetooth scan	bluez / bluez-utils

Installation & Deployment

To deploy the suite from your GitHub repository:

```
# Download NovaPkg
curl -LO https://raw.githubusercontent.com/dexomax/novapkg/main/novapkg

# Download NovaDrivers
curl -LO https://raw.githubusercontent.com/dexomax/novapkg/main/novadivers

# Set permissions
chmod +x novapkg novadivers

# Move to system path
```

```
sudo mv novapkg novadrivers /usr/local/bin/
```

Technical Logic

The system uses the following heuristic for driver identification:

Let H be the set of hardware IDs and D be the repository mapping. The function $f(H) \rightarrow D$ ensures system stability by matching kernel versions K_v with corresponding modules.
